This is caused by interference from differing pitches in the scanner's screen and your original's halftone screen. To reduce this effect, select Settings > Scanner Settings > Scan Settings and try adjusting these settings and scanning again:

  • On the Main Settings tab, try decreasing the Resolution setting.
  • On the Advanced Settings tab, select the Descreening setting.

### Streaks Appear in All Scanned Images

If streaks appear in all your scanned images, try these solutions:

  • Clean the glass surfaces inside your scanner using a genuine Epson cleaning kit or the microfiber cloth that may have come with your scanner.
  • The Epson ScanSmart software can alert you when dirt is detected on the scanner glass. Select Settings > Scanner Settings > Device Settings > Scanner Setting, select a setting for Detect Glass Dirt, and click Set.

  **Note:** Not all lines or dirt can be detected. Dirt may not be detected depending on its position, shape, and concentration. Select a higher or lower Detect Glass Dirt setting as necessary.

  • Keep the scanner cover closed when it is not in use to prevent dirt or dust from getting inside.

Image is Distorted or Blurry
If a scanned image appears distorted or blurry, try these solutions:
• Make sure your original is not wrinkled or warped. This may prevent the original from laying flat when passing over the scanner sensors.
• Do not move your original or your scanner during scanning.
- Your product will not operate properly while tilted at an angle. Place your product on a flat, stable surface that extends beyond its base in all directions.

- Select **Settings > Scanner Settings > Scan Settings**, adjust the following settings, and try scanning again:
  - On the **Main Settings** tab, try increasing the Resolution setting.
  - On the **Main Settings** tab, make sure you select the correct Image Type for your original.
  - If the Image Type is set to Black & White, adjust the Threshold setting on the Advanced Settings tab. (The Image Option must be set to None.)
  - If the Image Type is set to Color or Grayscale, select the Unsharp Mask setting on the Advanced Settings tab. Change the Text Enhancement setting to High.

### Scanned Image Colors Do Not Match Original Colors

Printed colors can never exactly match the colors on your computer monitor because printers and monitors use different color systems: monitors use RGB (red, green, and blue) and printers typically use CMYK (cyan, magenta, yellow, and black).

Check the color matching and color management capabilities of your computer, display adapter, and the software you are using to see if they are affecting the palette of colors you see on your screen.

To adjust the colors in your scanned image, select **Settings > Scanner Settings > Scan Settings**, adjust the following settings, and try scanning again:

- On the **Main Settings** tab, make sure you select the correct Image Type for your original.
- If the Image Type is set to Color or Grayscale, adjust the Contrast setting on the Advanced Settings tab.
• If the Image Type is set to Black & White, adjust the Color Enhance setting on the Advanced Settings tab.
