TrueOrder™ KDS

API Specification

## **About this Specification**

This specification presents the TrueOrder KDS API (Application Programming Interface), which is served over HTTP for customers looking for deeper integration with the KDS. The endpoint accepts HTTP POST requests to provide details on active orders; the client can either poll order status or register for callbacks from the KDS for actions such as item and order bumps and new order entry.

EPSON is a registered trademark and EPSON is a registered logomark of Seiko Epson Corporation. All other product and brand names are trademarks and/or registered trademarks of their respective companies. Epson disclaims any and all rights in these marks. Copyright 2025 Seiko Epson Corporation.

TrueOrder™ KDS API Specification Page 2 of 33

# 1. Introduction

TrueOrder KDS traditionally parses incoming "print jobs" from a Point of Sale System (POS) to an Epson POS printer. Each POS system that the Epson KDS supports requires a "parser" module to understand the format of the print job. This parser module is configured using the KDS Configuration Utility and the format must be followed from then on.

This method has advantages in that it is very easy to have a working KDS system without any changes required on the POS – there is no integration with the POS required. And for a POS that is not yet supported Epson can develop a new parser module which can typically be accomplished within 1-2 weeks.

A potential disadvantage to using a parser is that you are restricted to what the POS is capable of printing. The POS may not have the ability to print certain information that would be good to display. Or the POS may not have the ability to send void orders or append to an existing order for example.

This document outlines a specification for an "API" or Application Programming Interface to the Epson KDS system. The API provides an alternative direct way of communicating with the Epson KDS that not only allows data to be sent to the Epson KDS but also for KDS data to be returned. This allows for better control and feedback from the Epson KDS system. Development is thus required to follow the API protocol which is outlined in this specification.

If using a parser, the API can still be used to get feedback from the KDS system as this feedback can go anywhere. It does not need to go back to the POS.

**EPSON** 

TrueOrder™ KDS API Specification Page 3 of 33

# 2. API Interface

Data is exchanged between the POS and KDS using JSON format, which is described later in this document. The communication between POS and KDS is done using HTTP port 80 (and port 443 if SSL is enabled):

http(s)://192.168.192.168/cgi-bin/kdsapi/service.cgi

**HTTP POST** (*MAIN DELIVERY OPTION*) – JSON data will be the body of HTTP POST request and response using the following Content-Type:

Content-Type: application/json.

KDS devices might be configured to use a key to validate KDS API requests. In this case, an extra HTTP header "X-API-KEY" needs to be included in the request, and the value of this header field needs to match the key configured in target KDS device. If KDS device configured to use a key but the KDS API request does not contain the "X-API-KEY" header or the value of the header does not match the key in KDS device, an error response {"errorcode": 106, "description": "Unauthorized - key mismatch"} will be generated. Response error codes are listed in Section 4.3.

Please refer to Appendix for examples of sending kdsapi requests to TrueOrder devices from Linux and Windows platform.

**EPSON** 

TrueOrder™ KDS API Specification Page 4 of 33

# 3. API and POS Parsers

Traditionally, TrueOrder KDS allows a parser to be configured for the KDS to understand the POS data. A POS parser can still be selected and used in conjunction with the KDS API to provide flexibility for customers who wish to have multiple inputs to the POS system. Also the API can still be used to get feedback from the KDS.

The POS parser would still listen to the traditional inputs -> TCP port 9100 (or ePOS XML). The KDS API service is listening on TCP port 80 (and port 443 if SSL is enabled).

Out of box TrueOrder KDS device will function in a single station, parser-less mode of operation. In this unconfigured mode, the KDS accepts ASCII text-based data from the POS and displays it as-is on screen. This is a very basic mode of operation where the KDS allows full order bumps only, and consequently only full tile print-on-bump labels are supported. A special "Default Parser" is used here, which can also be selected from the web-based Configuration Utility for either multi-station setup or to restore this default mode. If a traditional POS parser is not required, one can remain in this default mode. However, to make full use of KDS features it is better to configure KDS with a parser for the used POS system.

# 4. Typical Order Receipt

A sample of a typical order receipt or kitchen chit (printout):

```
Server William
Table 7 CK# 0012
-----

1 Steak Burger
1 Fries
No salt
1 Coke
Regular
No ice
```

It can be broken down into the following basic fields:

- Server Name
- Table Number
- Check Number
- Item Qty
- Item Description
- Modifier(s)

TrueOrder KDS can show other miscellaneous information within the order such as course info, seat info, order types, customer name, customer phone number, customer email etc. This is described elsewhere within this specification.

#### 4.1. JSON Schema

The interface to the KDS API is based on the following JSON schema:

```
"seq" : number,
  "type" : "string",
  "server": "string",
  "table": "string",
  "check": "string",
  "cust name" : "string",
  "cust phone": "string",
  "cust email" : "string",
  "itemlist" :
       "itemid" : number,
       "item" : "string",
       "header": "string",
       "label" : "string",
       "qty" : number,
       "modifierlist" :
       Γ
          {
            "modifier" : "string",
            "colour" : "string"
       ]
     }
  ]
}
```

#### 4.1.1. JSON Schema: Detailed Description

• "seq" – JSON payload sequence number. Should be incremented by 1 for every API call to the Epson KDS. Range 0 – 1048575. Once the upper limit is reached it should roll back to 0. This field is required to be unique for each request so that TrueOrder device can send correct responses to clients if there are multiple kdsapi requests being serviced simultaneously. If simultaneous kdsapi requests are not required and instead happen one at a time, the "seq" field can be left unchanged at "0" or other constant number.

<b>EPSON</b>	V
--------------	---

TrueOrder™ KDS API Specification Page 7 of 33

- "type" Order type. Can be "new", "void", "append", "status", "callback". Each order type is described later.
- "server" Server name as it would be displayed in the KDS order header. It
  could be replaced with other text such as "Pickup", or "Delivery". While 0-35 ASCII
  characters are accepted the server name should be kept small so as to be
  displayed fully in the order header.
- "table" Table number as displayed in the KDS order header. 0-20 ASCII characters are accepted however the table number should be kept small to be displayed fully in the order header.
- "check" Check number for the order as displayed in the KDS order header. This
  check number should be unique for every new order entered into the system. 0-20
  ASCII characters are accepted however the check number should be kept small to
  be displayed fully in the order header.
- "cust\_name" Optional field indicating customer name. 0-35 ASCII characters are accepted.
- "cust\_phone" Optional field indicating customer phone number. Must be in one
  of the following formats:

(555)555-5555

555-555-5555

555555555

"cust\_email" - Optional field indicating customer e-mail address. 0-35 ASCII characters are accepted.

The "cust\_name", "cust\_phone", "cust\_email" are all optional and can be included or omitted in any combination.

Only 1 of the following 3 fields (item, header, label) should be sent:

- "item" Description of the item as displayed on the Epson KDS. E.g.
   "Hamburger". 0-35 ASCII characters.
- "header" Any information that should be displayed at the top of the order (below the KDS Order Header). Eg. "Dine-In, Take-Out. There can be multiple header fields but each should correspond to its own itemid. 0-35 ASCII characters.

<b>EPSON</b>	TrueOrder™ KDS API Specification Page 8 of 33	111-56-URM-010 R3.36
--------------	---	-------------------------

- "label" Any miscellaneous information to be displayed within the order. E.g. "Course 1", "Seat 2", or "Bar Seat 11". 0-35 ASCII characters.
- "itemid" The unique identifier assigned to an item by the POS. The itemid needs to be unique within an order and is used by the KDS to easily associate to an item. The best practice is for the first item in the list to have an id of 1 and then increase for every item. Numbers 1-99 are supported.
- "modifier" Description of the modifier as displayed on the Epson KDS. 0-35 ASCII characters.
- "colour" can be "normal" (default) or "alert" to show the text in the alert color.

The qty (quantity) following field is optional:

• "qty" – Quantity of the item as displayed on the KDS. Numbers 1-99 are supported.

## 4.2. Sample JSON Payload

```
"seq" : 1,
  "type" : "new",
  "server" : "William",
  "table" : "7",
  "check": "12",
  "cust_name" : "Robert",
  "cust phone": "555555555",
  "cust email" : "Robert@Robert.com",
  "itemlist":
  ]
        "itemid" : 1,
        "qty" : 1,
        "item" : "Steak Burger"
     } ,
        "itemid" : 2,
        "qty" : 1,
        "item" : "Fries",
        "modifierlist" :
        ]
             "modifier" : "No salt",
             "colour" : "alert"
        ]
     },
        "itemid" : 3,
        "qty" : 1,
        "item" : "Coke",
        "modifierlist" :
        ]
             "modifier" : "Regular"
           } ,
           {
             "modifier" : "No ice"
        ]
     }
  ]
}
```

### 4.3. Response Error Codes

The KDS will send back a response indicating success or failure. Upon success the following is returned:

```
"errorcode" : 0,
  "description" : "success"
}
```

Upon failure, an appropriate "errorcode" from the list below is returned:

- 1 json syntax error
- 2 callback entry does not exist
- 3 no callbacks are registered
- 4 order does not exist
- 5 invalid 'callbackid'
- 6 invalid callback 'trigger'
- 7 invalid callback 'url'
- 8 reached maximum order number
- 9 invalid json parameter
- 10 missing json parameter
- 101 data format error
- 104 timeout, no response from kds
- 105 Unknown error
- 106 Unauthorized key mismatch

# 5. Order Types

#### 5.1. "new" Order

#### 5.1.1. Request to KDS

Request for a brand-new order to be sent to the KDS:

```
"seq" : 1,
"type" : "new",
"server" : "William",
"table" : "7",
"check" : "12",
"cneck": "12",
"cust_name": "Robert",
"cust_phone": "555555555",
"cust_email": "Robert@Robert.com",
"itemlist":
[
          "itemid" : 1,
                                            Unique positive integer number within the order context
          "header" : "Dine-In"
                                           Will be displayed only once on screen ("header" type)
    },
         "itemid" : 2,
"header" : "Address: 185 Renfrew Dr."
          "itemid" : 3,
          "label" : "--- Course 1 ---"
                                                               Will be displayed as a special not-
                                                               selectable item on the screen
                                                               multiple times ("label" type)
     },
          "itemid" : 4,
         "qty" : 1,
"item" : "Steak Burger"
     },
          "itemid" : 5,
          "qty" : 1,
          "item" : "Fries",
          "modifierlist" :
              { "modifier" : "No salt", "colour" : "alert" }
     },
         "itemid" : 6,
"label" : "--- Course 2 ---"
     },
          "itemid" : 7,
         "qty" : 1,
"item" : "Coke",
          "modifierlist" :
               { "modifier" : "Regular" },
    }
]
```

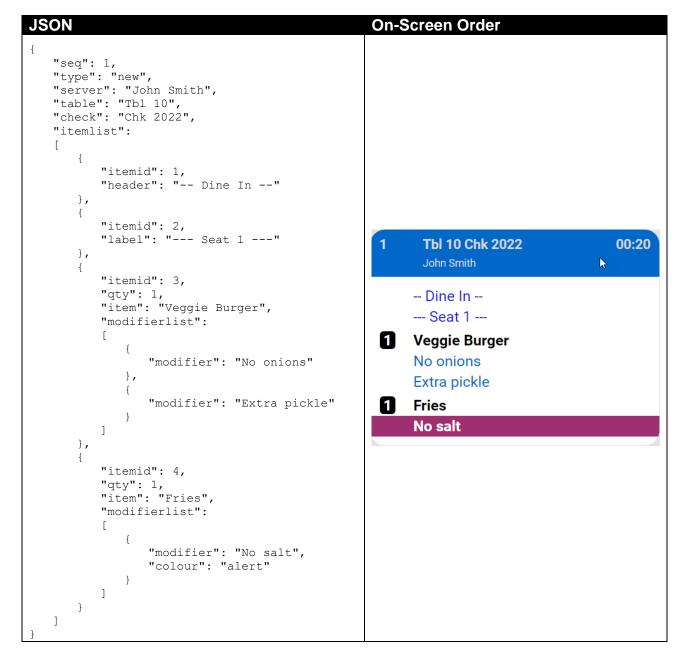

TrueOrder™ KDS API Specification Page 12 of 33

#### 5.1.2. Response from KDS

The KDS sends back a response indicating success or failure. Response error codes are listed in Section 4.3.

### **5.1.3. Example**

<b>EPSON</b>	TrueOrder™ KDS API Specification
	Page 13 of 33

### 5.2. "append" Order

#### 5.2.1. Request to KDS

Request for an addition to be sent to an already existing order. The check number should match a previous order:

The difference between "new" and "append" order is that appended orders will show the quantity column in a different background color on the KDS display to indicate the order was appended.

#### 5.2.2. Response from KDS

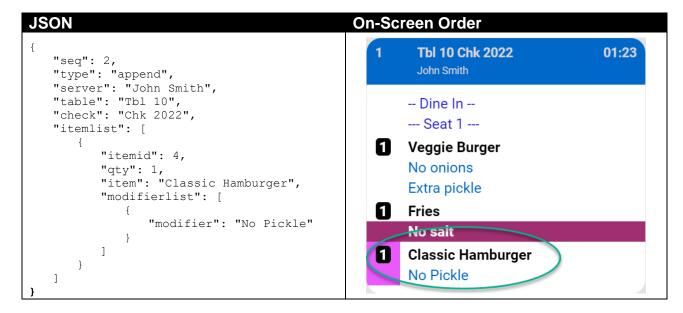

The KDS sends back a response indicating success or failure. Response error codes are listed in Section 4.3.

**EPSON** 

TrueOrder™ KDS API Specification Page 14 of 33

#### **5.2.3. Example**

Here we append to the same order sent in Example 5.1.3.

**EPSON** 

TrueOrder™ KDS API Specification Page 15 of 33

#### 5.3. "void" Order

#### 5.3.1. Request to KDS

Voiding the order will be facilitated with 'itemid' field to un-ambiguously find the exact item within the order.

When voiding "Fries" and "Coke" from above order, POS will send

```
{
    "seq" : 3,
    "type" : "void",
    "server" : "William",
    "table" : "7",
    "check" : "12",
    "itemlist" :
    [
        { "itemid" : 5 }, Fries
        { "itemid" : 6 }
        Coke
    ]
}
```

To void the whole order, POS will send request without item list.

```
"seq" : 3,
"type" : "void",
"server" : "William",
"table" : "7",
"check" : "12"
}
```

#### 5.3.2. Response from KDS

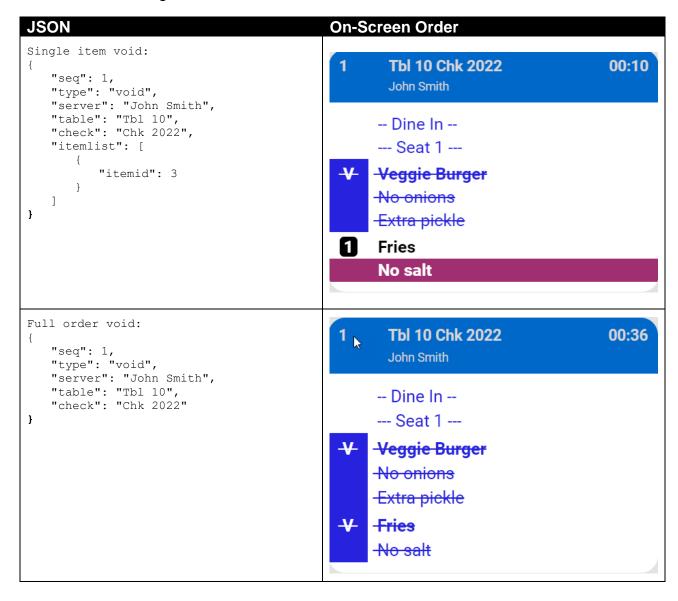

The KDS sends back a response indicating success or failure. Response error codes are listed in Section 4.3.

TrueOrder™ KDS API Specification Page 16 of 33

#### **5.3.3. Example**

Here we void a single item, and then void the entire order from Section 5.1.3.

<b>EPSON</b>	TrueOrder™ KDS API Specification	111-56-URM-010
	Page 17 of 33	R3.36

## 5.4. "status" of Order(s)

#### 5.4.1. Requests to KDS

#### 5.4.1.1. Single Order Status Request

#### **5.4.1.2. Multiple Orders Status Request**

For multiple orders, orderlist will contain multiple check numbers:

If orderslist is missing from the request to the KDS, then it implies all active orders, in which case all active orders will indeed be returned.

Furthermore, the parameter statusof can be:

- "ordersonly" for the status of orders, and the counts of active, bumped, voided items.
- "ordersanditems" same as "ordersonly" (i.e. order status and item counts), plus the status of all their items.

#### 5.4.2. "status" Response from KDS

There are some extra fields in the response in addition to "errorcode": state of order can be:

- "active" still cooking. This means, at least one item is "active".
- "bumped" the order has been completely bumped.
- "voided" the order has been completely voided

Similarly, the state of item can be:

- "active" still cooking
- "bumped" the item has been bumped
- "voided" the item has been voided

For "active" orders only, timeout of order will be one of:

- "normal" normal timer
- "priority" the timer reached Priority Time
- "rush" the timer reached Rush Time

If the order is "active", then elapsedtime is the number of second since the order was created, and it may have different values when the next POS request is made. If the order is "bumped" or "voided", then the elapsedtime is the number of second it took for the order to be bumped or voided, and it would remain the same for subsequent POS requests.

There are 4 distinct item counts in the response:

- "activeitemcount" the number of active items
- "bumpeditemcount" the number of bumped items
- "voideditemcount" the number of voided items
- "totalitemcount" the number of items in total, which is sum of above counts.

#### 5.4.2.1. "ordersonly" Response Type

If the request was "ordersonly", then KDS will return order status and item counts.

```
"errorcode" : 0,
  "description" : "success",
  "orderlist" :
        "check": "15",
        "table": "Table 9",
"server": "William",
        "cust_name" : "Robert",
        "cust_phone": "555555555",
        "cust email" : "Robert@Robert.com",
        "state": "active",
         "elapsedtime": 120,
        "timeout" : "normal",
        "activeitemcount" : 2,
        "bumpeditemcount" : 1,
        "voideditemcount": 1,
        "totalitemcount" : 4
     }
  ]
}
```

**EPSON** 

TrueOrder™ KDS API Specification Page 20 of 33

#### 5.4.2.2. "ordersanditems" Response Type

If the request was "ordersanditems", then KDS will return order status, item counts, and item status in further detail.

```
"errorcode" : 0,
"description" : "success",
"orderlist" :
[
          "check" : "15",
"table" : "Table 9",
          "server": "William",
          "cust_name": "Robert",
"cust_phone": "555555555",
"cust_email": "Robert@Robert.com",
          "state": "active",
          "elapsedtime" : 120,
          "timeout" : "normal",
          "activeitemcount" : 2, "bumpeditemcount" : 1,
          "voideditemcount": 1,
          "totalitemcount" : 4
          "itemlist" :
          [
                  "itemid" : 2,
"state" : "active",
                  "qty" : 1,
                  "item" : "Classic Burger",
                  "modifierlist":
                       { "modifier" : "No pickle" }
               },
                  "itemid" : 3,
"state" : "bumped"
                  "qty" : 1,
                  "item" : "Fries",
                   "itemid" : 4,
                  "state": "voided"
"qty": 1,
"item": "Coke",
               },
                   "itemid" : 5,
                  "state" : "active"
                  "qty" : 1,
"item" : "Classic Burger",
         ]
     }
]
```

TrueOrder™ KDS API Specification Page 21 of 33

### 5.4.2.3. "status" Error Response

If there is an error responding to a "status" request on the KDS side, the response will contain the appropriate error code as per Section 4.3.

# 6. Callback Registration

Callbacks can be registered with a KDS device for the customer's own server to receive information for various events, such as new order entry, or an order or item bump.

### 6.1. "callback" Request to KDS

```
"seq" : 11,
"type" : "callback",
"callbackid" : 1,
"action" : "set",
"url" :
"http://192.168.1.100:8080/kdsapi/callback_listener.cgi",
"trigger" : "onbump"
}
```

#### Where:

- url can be standard HTTP POST, like
  - o "http://192.168.1.100:8080/kdsapi/callback\_listener.cgi". Please refer to Appendix for sample cgi file.
- callbackid is a unique identifier assigned to the callback entry. This identifier can be used to delete the entry later or to overwrite the existing callback. The value should start at 1 and increment by 1 for each new callback registered. When action is "set", if there was no callback registered using this callbackid before, a new callback with this ID will be registered, otherwise if there is an existing callback with this ID, it will be overwritten by the new one.

Note: Once a callback is registered or deleted, it takes immediate effect without requiring a reboot of the KDS device, and persists across power cycles until deleted using the relevant callbackid.

- action can be
  - "set" to create or overwrite a callback entry,
  - o "clear" to delete the entry,
- trigger is the condition that causes KDS to call back. It can be
  - o "onenter" KDS will return both check, table and itemid(s) when an order is entered.

EPSON APISP	der™ KDS pecification 23 of 33 111-56-URM-010
-------------	---

- o "onbump" KDS will return both check, table and itemid(s) when a bump takes place.
- o "onpriority" when the timer of order reaches Priority Time, KDS will return check, table.
- o "onrush" when the timer of order reaches Rush Time, KDS will return check, table.
- o "onunbump" KDS will return both check, table and itemid when an item is unbumped.
- o "onrecall" KDS will return both check, table when an order recall takes place.

# 6.2. "callback" Response from KDS

The KDS sends back a response indicating success or failure. Response error codes are listed in Section 4.3.

<b>EPSON</b>	
--------------	--

# 7. Callback Notifications from KDS

#### 7.1. "onenter" Callback

The "new", "append", "void" requests will all generate "onenter" callback, with type "new", "append", or "void" separately. If the trigger is "onenter" then the KDS will send the original print job to the registered callback URL in the following JSON format. Optional "cust\_name", "cust\_phone" and "cust\_email" will be included if these fields were included in "new" order request by the POS.

#### · Callback for "new"

```
{
    "type" : "new",
    "check": "0025",
    "table" : "Table 15",
    "server" : "Mark",
    "cust name" : "Robert",
    "cust phone": "555555555",
    "cust email" : "Robert@Robert.com",
    "itemlist" :
            "itemid" : 1,
            "qty" : 1,
            "item" : "Meat Lover",
            "modifierlist" :
            [ {
                    "modifier" : "> Olives",
                    "color" : "alert"
                },
                    "modifier" : "> NO Mushrooms"
            ]
        },
            "itemid" : 2,
            "label" : "- Also sent to:Station 1"
        },
            "itemid" : 3,
            "label" : "- Also sent to:Pizza Oven"
    1
}
```

**EPSON** 

TrueOrder™ KDS API Specification Page 25 of 33

```
• Callback for "append"
  "type" : "append",
  "check" : "0025",
  "table" : "Table 15",
  "server" : "Mark","
  "cust name" : "Robert",
  "cust phone" : "555555555",
  "cust email" : "Robert@Robert.com",
  "itemlist":
  [
       "itemid" : 8,
       "qty" : 1,
       "item" : "Classic Burger",
       "modifierlist" :
          { "modifier" : "No pickle" }
     }
```

**EPSON** 

TrueOrder™ KDS API Specification Page 26 of 33

]

}

#### • Callback for "void"

```
"type" : "void",
  "check": "0025",
  "table": "Table 15",
  "server" : "Mark","
  "cust name" : "Robert",
  "cust phone": "555555555",
  "cust email" : "Robert@Robert.com",
  "itemlist" :
        {
             "itemid" : 1,
             "qty" : 1,
             "item" : "Meat Lover",
             "modifierlist" :
                 {
                     "modifier" : "> Olives",
                     "color" : "alert"
                 },
                     "modifier" : "> NO Mushrooms"
                 }
             ]
        }
  ]
}
Note that a callback generated by full order void will not contain any item:
  "type" : "void",
  "check": "0025",
  "table" : "Table 15",
  "server" : "Mark","
  "cust name" : "Robert",
  "cust phone" : "5555555555",
```

Callback generated by void item 1 of above example will be:

"cust email" : Robert@Robert.com

TrueOrder™ KDS API Specification Page 27 of 33

111-56-URM-010 R3.36

}

### 7.2. "onbump" Callback

If the trigger is "onbump" and an order is bumped, then KDS will send check, table of the bumped order. Optional "cust\_name", "cust\_phone" and "cust\_name" will be included if these fields were included in "new" order request.

```
"type": "callback",
    "callbackid": 1,
    "trigger": "onbump",
    "check": "12",
    "table": "Table 7"
    "cust_name": "Robert",
    "cust_phone": "555555555",
    "cust_email": "Robert@Robert.com"
}
```

If the trigger is "onbump" and an item is bumped (on SCROLL mode), then KDS will send the same content as order bump, together with itemid, itemname and modifiers for this item.

```
"type": "callback",
    "callbackid": 1,
    "trigger": "onbump",
    "check": "12",
    "table": "Table 7",
    "cust_name": "Robert",
    "cust_phone": "555555555",
    "cust_email": "Robert@Robert.com",
    "itemid": 8
    "item": "Classic Burger",
    "modifierlist":
    [
        { "modifier": "No pickle" }
    ]
}
```

**EPSON** 

TrueOrder™ KDS API Specification Page 28 of 33

## 7.3. "onpriority" Callback

If the trigger is "onpriority" or "onrush", and an order becomes Priority or Rush, respectively, then KDS will send check, table of that order.

```
{
  "type": "callback",
  "callbackid": 2,
  "trigger": "onpriority",
  "check": "12",
  "table": "Table 7"
}
```

### 7.4. "onrush" Callback

```
{
  "type": "callback",
  "callbackid": 3,
  "trigger": "onrush",
  "check": "12",
  "table": "Table 7"
}
```

## 7.5. "onunbump" Callback

If the trigger is "onunbump" and an order item is unbumped (on SCROLL mode or directly unbump from touch screen), then KDS will send check, table of the bumped order and the bumped itemid, itemname and modifierlist for the item.

```
"type": "callback",
   "callbackid": 1,
   "trigger": "onunbump",
   "check": "12",
   "table": "Table 7",
   "cust_name": "Robert",
   "cust_phone": "555555555",
   "cust_email": "Robert@Robert.com",
   "itemid": 8,
   "item": "Classic Burger",
   "modifierlist":
   [
        { "modifier": "No pickle" }
   ]
}
```

TrueOrder™ KDS API Specification Page 29 of 33

### 7.6. "onrecall" Callback

If the trigger is "onrecall" and an order is recalled, then KDS will send <code>check</code>, <code>table</code> of the bumped order.

```
"type": "callback",
"callbackid": 1,
"trigger": "onrecall",
"check": "12",
"table": "Table 7",
"cust_name": "Robert",
"cust_phone": "555555555",
"cust_email": "Robert@Robert.com"
}
```

## 7.7. POS/Server Response

The Epson KDS ignores any response from the POS or customer server.

**EPSON** 

TrueOrder™ KDS API Specification Page 30 of 33

# 8. "status" of Callback

### 8.1. Request to KDS

```
{
  "type": "status",
  "seg": 12,
  "statusof": "callback",
  "callbacklist":
  [
      { "callbackid": 1 },
      { "callbackid": 2 },
      { "callbackid": 3 }
  ]
}
```

If callbacklist is missing or empty, then it implies all existing callbacks.

### 8.2. Response from KDS

```
"errorcode" : 0,
"description" : "success",
"callbacklist" :
[
     "callbackid" : 1,
     "http://192.168.1.100:8080/kdsapi/callback listener.cgi",
     "trigger": "onbump"
  },
     "callbackid" : 2,
     "url" :
     "http://192.168.1.100:8080/kdsapi/callback listener1.cgi",
     "trigger": "onpriority"
  }
     "callbackid" : 3,
     "url" : "",
     "trigger" : ""
} ]
```

If there is an error, then errorcode will be non-zero with appropriate description. List of error conditions are in Section 4.3.

# 9. Callback Behavior in Multi-Station Mode

In single station mode the behavior is simple: when a certain action occurs, and if the corresponding callback is registered, then the KDS station sends the callback data to the registered server URL (endpoint).

For multi-station mode, each KDS device will generate callbacks for actions related to its own display. However, the Master device (the configured "POS Connected" device) can generate callbacks for itself, as well as certain callbacks on behalf of other displays too. This behavior is described in the table below:

**Table 9.1: Multi-Station Callback Behaviour** 

		Master Device (POS Connected Device)		
	Display Device (Non-Master)	POS Routing	KDS Routing	
onenter	- New order: Trigger "new" onenter callback on the device if this order is displayed on it  - Append: Trigger "append" onenter callback on the device if this append occurs on it  - Void: Trigger "void" onenter callback on the device if this void occurs on it	Same as Display Device	New order: All new order coming to the whole system trigger master "new" onenter callback     Append: All append action coming to the whole system trigger "append" onenter callback     Void: All void action coming to the whole system trigger "void" onenter callback	
onpriority	Triggered by orders displayed on its screen hitting priority time	Same as Display Device	Same as Display Device	
onrush	Triggered by orders displayed on its screen hitting rush time	Same as Display Device	Same as Display Device	
onbump (order)	Triggered by order bumped from itself	Same as Display Device	Triggered by all order bump from all devices	
onbump (item)	Triggered by item bumped from itself	Same as Display Device	Triggered by all item bump from all devices	
onunbump (item)	Triggered by item unbumped from itself	Same as Display Device	Triggered by all item unbump from all devices	
onrecall (order)	Triggered by item recalled from itself	Same as Display Device	Same as Display Device

# **Appendix**

#### Sending kdsapi requests to TrueOrder devices

There are different ways to send JSON format kdsapi requests to TrueOrder devices. One simple approach is to use "curl" command line tool under Linux or Windows to send a JSON file. For example, if you have **neworder.json** file with a valid kdsapi request format as per Section 4.2, then to send this request to KDS device 192.168.192.168:

- Under Windows 11/10 (Built in Windows 11 and newer build of Windows 10)
   Active "Command Prompt" and run below command:
   curl -sS --data "@neworder.json" -H "Content-Type:application/json"
   http://192.168.192.168/cgi-bin/kdsapi/service.cgi
- Under Linux (Install "curl" command line tool)
   From command terminal run command:
   curl -sS -H 'Content-Type: application/json' --data-binary "@neworder.json"
   http://192.168.192.168/cgi-bin/kdsapi/service.cgi

The kdsapi request will be sent to the KDS device. The device will display that order, and the Linux command line terminal will receive a valid JSON response:

```
"errorcode" : 0,
  "description" : "success"
}
```

#### • Sample CGI to receive kdsapi callback from TrueOrder devices

Assume a webserver is setup to receive HTTP POST at port 8080 under folder kdsapi, and a kdsapi callback has been registered to "callback\_listener.cgi" as described in Section 6.2. The backend CGI can be written in different script languages to receive the callback content and process further. Below is a simple Linux shell (bash) CGI example to receive callback contents and save them to a file under path [ /var/www/html/callbacks ] using the receive timestamp as file name, and finally send a success response to the KDS device.

```
#!/bin/sh

cat > "/var/www/html/callbacks/$(date +'%F %H%M%S.%N')"

cat << EOF
Content-length: 56
Connection: close
Content-Type: application/json

{
    "errorcode": 0,
    "description": "success"
}</pre>
```
